**PRIORITY
DOCUMENT**

SUBMITTED OR TRANSMITTED IN
COMPLIANCE WITH RULE 17.1(a) OR (b)

EU

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Signed *RJ Sanders*

(See the notes on the back of this form. You can also get an explanatory leaflet from the Patent Office to help you fill in this form)

The Patent Office

Cardiff Road
Newport
Gwent NP9 1RH

1. Your reference **E036887PGB**

2. Patent application number **26 MAR 1998 9806543.6**
(The Patent Office will fill in this part)

3. Full name, address, and postcode of the or of each applicant (underline all surnames)
LUCAS INDUSTRIES public limited company
Stratford Road,
Solihull, B90 4LA,
England.

Patents ADP number (if you know it)

If the applicant is a corporate body, give the country/state of its incorporation

England.

576694002

4. Title of the invention
DISC BRAKE SEAL ASSEMBLY

5. Name of your agent (if you have one)
"Address for Service" in the United Kingdom to which all correspondence should be sent (including the postcode)
Marks & Clerk
Alpha Tower
Suffolk Street Queensway
Birmingham B1 1TT

Patents ADP number (if you know it) **18002**

6. If you are declaring priority from one or more earlier patent applications, give the country and the date of filing of the or of each of these earlier applications and (if you know it) the or each application number

Country	Priority application number (if you know it)	Date of filing (day / month / year)

7. If this application is divided or otherwise derived from an earlier UK application give the number and filing date of the earlier application

Number of earlier application	Date of filing (day / month / year)

8. Is a statement of inventorship and of right to grant of a patent required in support of this request? (Answer 'Yes' if:

YES

- a) any applicant named in part 3 is not an inventor, or
 - b) there is an inventor who is not named as applicant, or
 - c) any named applicant is a corporate body.
- See note (d))

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

DISC BRAKE SEAL ASSEMBLY

This invention relates to a seal device for use in sealing between parts of a thrust assembly of a disc brake, primarily for a motor vehicle, and to a disc brake incorporating the seal device and thrust assembly.

One conventional type of thrust assembly, in the form of an adjustable tappet assembly, has a pair of threadedly interengaged parts forming a strut of which the length can be varied by relative rotation between the parts to perform a brake adjustment, in use. In order to provide the necessary sealing between the relatively rotatable strut parts and between the strut parts and adjacent surfaces, it has been necessary to provide multiple seals and inserts for their retention and/or support, as well as machining of the parts to provide adequate sealing surfaces for engagement by the various seals. Such arrangements are complicated to manufacture and assemble, giving rise to relatively high costs.

An object of the invention is to provide a simpler and more cost-effective seal device for use in a thrust assembly of a disc brake, as compared with the aforesaid conventional arrangements.

According to a first aspect of the invention, a seal device for use in sealing between parts of a thrust assembly of a disc brake comprises a support element adapted to be carried externally by a first part of the thrust assembly, the support element carrying a seal element arranged so that, with the support element in its position of use on the first part the seal element engages a surface of a second part of the thrust assembly in sealing relationship.

In one convenient arrangement, an outer surface of the support element serves, in use, for engagement by a further seal element carried by adjacent structure.

Preferably, the support element is in the form of a cap having a generally annular flange adapted to fit, in use, over an end portion of the first element, the outer surface of the flange serving for engagement by said further seal element.

According to another aspect of the invention, a seal device for use in sealing between parts of a thrust assembly of a disc brake comprises a support element adapted to be carried by a first part of the thrust assembly, the support element carrying a seal element arranged so that, with the support element in its position of use on the first part the seal element engages a surface of a second part of the thrust assembly in sealing relationship, the support element being arranged so that an outer surface thereof serves, in use, for engagement by a further seal element carried by adjacent structure.

Preferably, the support element is carried externally by said first part of the thrust assembly and is conveniently in the form of a cap having a generally annular flange adapted to fit, in use, over an end portion of the first element, the outer surface of the flange serving for engagement by said further seal element.

According to a further aspect of the invention, a thrust assembly comprises a pair of relatively movable parts, and a seal device which has a support element carried externally by a first of said parts, the support

element carrying a sealing element arranged so that the seal element engages a surface of a second of said parts in sealing relationship.

Conveniently, an outer surface of the support element provides a sealing surface engaged by a further seal element carried by adjacent structure.

The support element is preferably in the form of a cap having a generally annular flange fitted over an end portion of the first element, the outer surface of the flange providing the sealing surface engaged by the further seal element.

According to a yet further aspect of the invention a thrust assembly comprises a pair of relatively movable parts, and a seal device which has a support element carried by a first of said parts, the support element carrying a sealing element arranged so that the seal element engages a surface of a second of said parts in sealing relationship, the support element being arranged so that an outer surface thereof serves, in use, for engagement by a further seal element carried by adjacent structure.

Preferably the support element is carried externally by said first part and is conveniently in the form of a cap having a generally annular flange fitted over an end portion of the first element, the outer surface of the flange providing the sealing surface engaged by the further seal element.

The invention will now be described, by way of example, with reference to the accompanying drawings in which:-

Figure 1 is a plan view, partly in cross-section, of one form of the brake of the invention;

Figure 2 is a cross-section along line A-A of Figure 1, and

Figure 3 is an enlarged cross-sectional view of a thrust member forming part of the brake of Figures 1 and 2.

Referring to Figures 1 and 2 of the drawings, the illustrated disc brake has a fixed carrier 1 which carries a pair of friction pads 2, 3 disposed respectively at either side of a brake disc 4. The carrier serves to mount the brake on a vehicle and to absorb torque sustained by the pads during a braking operation. A clamp member or caliper 5 straddles the brake disc and is mounted on the carrier so as to be slidable axially of the brake disc relative to the carrier, by way of pins 6, in conventional manner. The caliper carries an integral housing 7 which is adapted to mount a conventional air or other power actuator (not shown) on an external face 8 thereof. The housing defines a chamber 9 within which a pivotal brake actuating lever 10 may conveniently perform an angular reciprocal swinging movement, as indicated by the arrows, under the action of a thrust member of the power actuator which, with the latter mounted on the face 8, extends through an opening 11 of the housing into engagement with a recess 12 of the lever 10. The lever is integral with or attached to a rotary actuating member 13 which is rotatably supported within the caliper by way of a pair of needle bearing assemblies 14. The member 13 is recessed to house respective cylindrical rollers 15, 16, the axes of which are offset from the rotary axis of the actuating member 13 and form an eccentric actuating arrangement with the rollers 15 and 16 bearing against respective thrust members 17A and 18A of adjacent adjustable tappet assemblies indicated generally at 17 and 18. Rotation of the lever 10 and its connected shaft 13 causes actuating thrust to be applied via the tappet assemblies to the directly

actuated friction element 2 and, by a reaction via the caliper 5, to the indirectly actuated friction element 3.

The thrust assemblies, illustrated as adjustable tappet assemblies 17 and 18, are disposed at either side of a centre line of the brake passing through the lever 10 and are associated with an adjuster assembly 19 which lies laterally offset from but adjacent the tappet assembly 18. The adjuster assembly may be of any appropriate conventional type needing no detailed description for the purpose of the present invention. The adjuster responds to excessive movement of the friction elements 2, 3 and produces resultant rotation of an adjuster shaft 20 which, via an output gear 21 and an intermediate idler gear 21A, rotates a pair of input gears 22, 23 associated respectively with the adjustable tappet assemblies 17, 18.

The tappet assemblies are of identical construction and operation, and only the assembly 17 will be described in sufficient detail for a full understanding of the present invention. This assembly has an outer sleeve 24 which is internally threaded at 24A and receives a hollow internal shaft 25 having an externally threaded portion 25A extending over a part of its length for cooperation with the internal thread of the sleeve 24. The shaft and sleeve form between them an adjuster strut of variable length. The shaft 25 is provided, at its outer end, with a tappet head 26, which bears against the adjacent friction element 2 and which is releasably coupled to the shaft so as, conveniently, to be freely rotatable relative to the latter. To enable the shaft 25 to be moved axially by rotation of the sleeve 24 so as to extend the adjuster strut in compensation for wear of the friction elements, it is necessary to lock this shaft against rotary movement. This is achieved, in the present

embodiment, by providing the thrust member 17A, which is engaged over the adjacent end of the sleeve 24, with an elongate stem 27 of non-circular cross-section which extends within the hollow shaft 25, of which at least a part of the internal surface forms a complementary bore. The thrust members 17A and 18A of the respective tappet assemblies are each provided with, for example, a generally planar external surface for locking engagement with a corresponding adjacent surface on a fixed plate 28.

The present invention is concerned particularly with improving the sealing arrangement between the outer sleeve 24 and inner shaft 25 and, to this end, an end portion of the sleeve 24 adjacent the tappet head 26 is relieved to provide a reduced diameter portion 29, which carries a support element 31 of a seal device. An annular flange 30 of the support element is received over the portion 29, conveniently by press-fitting. A flat annular portion 32 of the support element rests against the adjacent end of the sleeve 24 and carries a seal element, of which an annular rim 33 is housed within the portion 32, and of which an annular lip 34 forms a seal engaging the outer surface of the sleeve 25. The support element 31 may conveniently be manufactured from stainless steel or similar material. A metal retainer 35 has a first annular portion 36, which is a press fit in the caliper 5, to which is attached a further lip seal 37 engaging the outer surface of the cylindrical part 30 of the portion 32, such outer surface providing a smooth sealing surface for cooperation with the lip seal 37. The retainer 35 has a further annular portion 38 lying against an adjacent surface of the caliper 5, the remainder of the retainer forming an annular channel 39 to receive a bead 40 of a main convoluted boot seal 41, a further bead 42 of which is received within a groove of the tappet head 26.

The above-described sealing device 31 is particularly advantageous in terms of its simplicity and effectiveness in providing a high integrity seal between the sleeve 24 and shaft 25 and also in providing a smooth sealing surface on its cylindrical part 30, for engagement by the further seal 37, thereby largely obviating the necessity for high quality expensive machining and/or plating of the outer surface of the sleeve 24 for sealing purposes.

It will be understood that the seals 34 and 37 may be of any convenient form and retained in any convenient manner on their respective supports 31, 35 which, in turn, may have any convenient shape whilst retaining their essential purpose according to the invention.

The flat annular portion 32 may conveniently provide stop means for limiting the axial movement of the tappet assembly at extremes of adjustment.
